TUFFY® MILK FILTERS

TUFFY® Filter Media is a multi-purpose, non-woven material designed to have the strength, speed and capacity to function efficiently in vacuum, gravity and low- or high-pressure pipeline installations.

You specify the size and TUFFY® Filters will handle the rest. Schwartz™ has combined the latest developments in fiber and chemical technology to produce a filter media that begins filtering instantly and continues to remove fine sediment, without loss of wet strength or flow rate, to the end of the milking.

The depth of filtration delivered by TUFFY® removes more silts and fine clay sediments than competitive filters. They are ideal for:

- Preventing sediment residue in bulk tanks.
- Filtering during wash-up to protect the plate cooler.
- Filtering ahead of the plate cooler to protect equipment from expensive repairs.
